

CATGUT PLAIN and CHROMIC

Catgut is a natural absorbable suture that has been used in surgery for more than 100 years. In spite of its multifilament structure it behaves like a Monofilament in practice. The chromis type is of green colour and has a longer absorption time than Catgut plain.

Approximate Absorption times:

Catgut Chromic	15-20 half-life (days)	60 dissolution time (days)
Catgut Plain	6-8 half-life (days)	30 dissolution time (days)

Benefits

- Economical
- Naturally treated with chromic salts to aid absorption
- Proven quality over many years
