

VIJEC FOLIC ACID

For Folic Acid Responsive Anaemias of Horses and Dogs

Active Constituents (per g):

15 mg/ml folic acid.

Description:

A clear yellow solution in 50ml vials.

Mode of Action:

Folic acid is necessary for normal production of red blood cells and is closely associated with the physiological and biochemical role of cyanocobalamin. Both are important factors of carbohydrate, fat and protein metabolism.

Folic acid and Vitamin B12 are required for nucleic acid synthesis. A deficiency of these products results in macrocytic normochromic anaemia.

Indications:

For use in folic acid responsive anaemias of horses and dogs. Following prolonged treatment with sulphonamides or antibiotics. As an adjunct to Vitamin B12 therapy.

Dosage:

Horses 7.5ml daily for 4-7 days.

Dogs 1ml daily for 4-7 days.

Registered pursuant to the ACVM Act 1997,
NoA5425
